

UEFI & EDK II TRAINING

How to Write a UEFI Driver - Porting Lab - Windows

tianocore.org

See also [LabGuide.md](#) for Copy & Paste examples in labs

Lesson Objective

- ★ Compile a UEFI driver template created from UEFI Driver Wizard
- ★ Test driver w/ Windows Emulation using UEFI Shell 2.0
- ★ Port code in the template driver

Note: Since this is a lab, to follow examples for copy & paste, use the following Markdown link [LabGuide.md](#)

LAB 1: UEFI DRIVER TEMPLATE

Use this lab, if you're not able to create a UEFI Driver Template using the UEFI Driver Wizard.

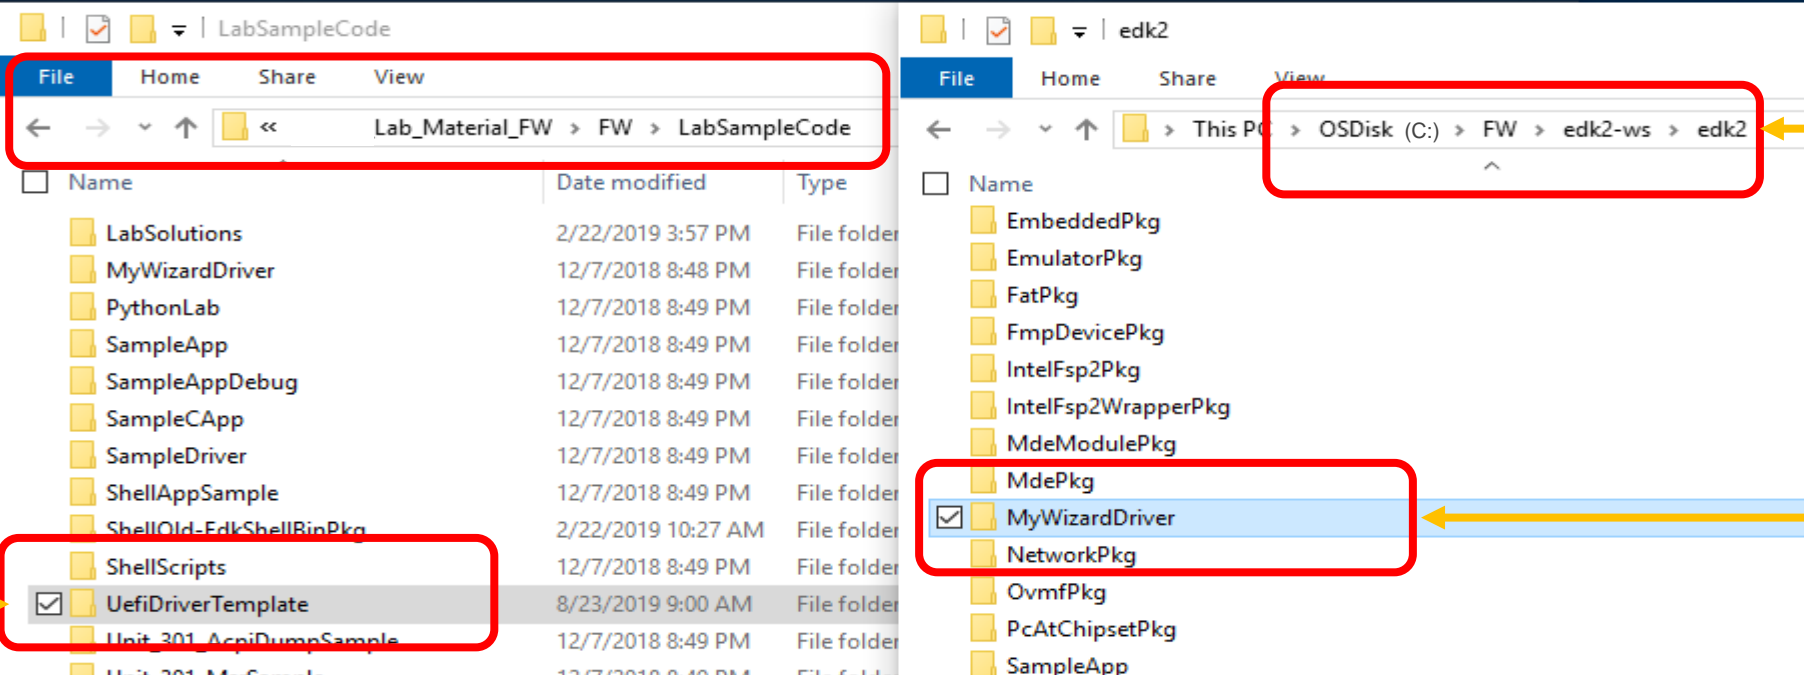

Note: Skip if LAB 1 UEFI Driver Wizard completed successfully

Lab 1: Get UEFI Driver Template

If UEFI Driver Wizard does not work:

1. Copy the directory UefiDriverTemplate from
`... ./FW/LabSampleCode/` to `C:/FW/edk2-ws/edk2`
2. Rename Directory UefiDriverTemplate to MyWizardDriver

The screenshot shows two file explorer windows. The left window is at 'LabSampleCode' and the right window is at 'edk2'. A 'Copy' button points to the 'UefiDriverTemplate' folder in the left window. A 'Paste' button points to the 'edk2' folder in the right window. A 'Rename' button points to the 'MyWizardDriver' folder in the right window.

Name	Date modified	Type

Review [UEFI Driver Wizard Lab](#) for protocols produced and which are being consumed

LAB 2: BUILDING A UEFI DRIVER

In this lab, you'll build a UEFI Driver created by the UEFI Driver Wizard. You will include the driver in the Emulator project. Build the UEFI Driver from the Driver Wizard

Compile a UEFI Driver

Two Ways to Compile a Driver	
<i>Standalone</i>	<i>In a Project</i>
The build command directly compiles the .INF file	Include the .INF file in the project's .DSC file
Results: The driver's .EFI file is located in the Build directory	Results: The driver's .EFI file is a part of the project in the Build directory

Lab 2: Build the UEFI Driver

- Perform [Lab Setup](#) from previous EmulatorPkg Labs
- Open `C:/FW/edk2-ws/edk2/EmulatorPkg/EmulatorPkg.dsc`
- Add the following to the [Components] section:

Hint: add to the last module in the [Components] section

```
# Add new modules here
MyWizardDriver/MyWizardDriver.inf
```

- Save and close the file `C:/FW/edk2-ws/edk2/EmulatorPkg/EmulatorPkg.dsc`

Lab 2: Build and Test Driver

Open a VS Command Prompt and type: `cd C:/FW/edk2-ws` then

```
$> setenv.bat  
$> cd edk2  
$> edksetup
```

Build the MyWizardDriver with the Windows Emulation**

```
$> Build  
$> RunEmulator.bat
```

Load the UEFI Driver from the shell

At the Shell prompt, type **Shell> fs0:**

Type: **FS0:\> load MyWizardDriver.efi**

```
Shell> fs0:  
FS0:\> load MyWizardDriver.efi  
Image 'FS0:\MyWizardDriver.efi' loaded at 5E7F000 - Success  
FS0:\> _
```

Build ERRORS: Copy the solution files from /FW/LabSampleCode/LabSolutions/LessonC.1 to C:/FW/edk2-ws/edk2/MyWizardDriver

** Make sure BUILD Switches from LAB C_03. . . are enabled in EmulatorPkg.dsc

Lab 2: Test Driver

At the shell prompt Type: `FS0:\> drivers`

Verify the UEFI Shell loaded the new driver. The drivers command will display the driver information and a driver handle number ("a9" in the example screenshot)

```
92 00000011 ? - - - - Usb Mass Storage Driver      UsbMassStorageDxe
93 00000010 B - - 1 1 QEMU Video Driver             QemuVideoDxe
94 00000010 ? - - - - Virtio GPU Driver             VirtioGpuDxe
A9 00000000 ? - - - - MyWizardDriver             \MyWizardDriver.efi
FS0:\>
```

Lab 2: Test Driver

At the shell prompt using the handle from the drivers command,
Type: `dh -d a9`

Note: The value a9 is the driver handle for MyWizardDriver. The handle value may change based on your system configuration.(see example screenshot - right)

```
FS0:\> dh -d a9
A9: SupportedEfiSpecVersion(0x0002003C) ComponentName2 ComponentName DriverBin
ng HiiPackageList ImageDevicePath(..0xFBFC1)\MyWizardDriver.efi) LoadedImage(
yWizardDriver.efi)
  Driver Name [A9]      : MyWizardDriver
  Driver Image Name    : \MyWizardDriver.efi
  Driver Version       : 00000000
  Driver Type         : <Unknown>
  Configuration       : NO
  Diagnostics         : NO
  Managing            : None
FS0:\> _
```

Lab 2: Test Driver

At the shell prompt using the handle from the drivers command,

Type: `FS0:/ > unload a9`

See example screenshot - below

Type: drivers again

Notice results of unload command

Exit type `FS0:/ > Reset`

```
Managing - none
FS0:\> unload a9
Unload - Handle [6B1B798] . [y/n]?
y
Unload - Handle [6B1B798] Result Success.
FS0:\> _
```

LAB 3: COMPONENT NAME

In this lab, you'll change the information reported to the drivers command using the ComponentName and ComponentName2 protocols.

Lab 3: Component Name

- **Open** C:/FW/edk2-ws/edk2/MyWizardDriver/ComponentName.c
- **Change** the string returned by the driver from MyWizardDriver to:
UEFI Sample Driver

```
/// Table of driver names
///
GLOBAL_REMOVE_IF_UNREFERENCED
EFI_UNICODE_STRING_TABLE mMyWizardDriverDriverNameTable[] = {
    { "eng;en", (CHAR16 *)L"UEFI Sample Driver" },
    { NULL, NULL }
};
```

- **Save** and close the file:
C:/FW/edk2-ws/edk2/MyWizardDriver/ComponentName.c

Lab 3: Build and Test Driver

At the VS Command Prompt

```
$> Build  
$> RunEmulator.bat
```

Load the UEFI Driver from the shell

At the Shell prompt, type **Shell> fs0:**

Type: **FS0:\> load MyWizardDriver.efi**

Type: **FS0:\> drivers**

Observe the change in the string
that the driver returned

Exit type **FS0:/ > Reset**

```
92 00000011 ? - - - - Usb Mass Storage Driver      UsbMassStorage
93 00000010 B - - 1 1 QEMU Video Driver             QemuVideoDxe
94 00000010 ? - - - - Virtio Gpu Driver             VirtioGpuDxe
A9 00000000 ? - - - - - UEFI Sample Driver         \MyWizardDrive
FS0:\> -
```

LAB 4: PORTING THE SUPPORTED & START FUNCTIONS

The UEFI Driver Wizard produced a starting point for driver porting ... so now what?

In this lab, you'll port the “Supported” and “Start” functions for the UEFI driver

Lab 4: Porting Supported and Start

Review the Driver Binding Protocol

Supported()

Determines if a driver supports a controller

Start()

Starts a driver on a controller & Installs Protocols

Stop()

Stops a driver from managing a controller

Lab 4: The Supported() Port

The UEFI Driver Wizard produced a Supported() function, but it only returns EFI_UNSUPPORTED

Supported Goals:

- Checks if the driver supports the device for the specified controller handle
- Associates the driver with the Serial I/O protocol
- Helps locate a protocol's specific GUID through UEFI Boot Services' function

Lab 4: Help from Robust Libraries

EDK II has libraries to help with porting UEFI Drivers

AllocateZeroPool() include - [MemoryAllocationLib.h]

SetMem16() include - [BaseMemoryLib.h]

Check the MdePkg with libraries help file (.chm format)

Lab 4: Update Supported

- **Open** C:/FW/edk2-ws/edk2/MyWizardDriver/MyWizardDriver.c
- **Locate** MyWizardDriverDriverBindingSupported(), the supported function for this driver and comment out the "//" in the line: "return EFI_UNSUPPORTED; "

```
EFI_STATUS
EFIAPI
MyWizardDriverDriverBindingSupported (
    IN EFI_DRIVER_BINDING_PROTOCOL *This,
    IN EFI_HANDLE                  ControllerHandle,
    IN EFI_DEVICE_PATH_PROTOCOL    *RemainingDevicePath OPTIONAL
)
{
    // return EFI_UNSUPPORTED;
}
```

- **copy** and past (next slide)

Lab 4: Update Supported Add Code

Copy & Paste the following code for the supported function

MyWizardDriverDriverBindingSupported():

```
EFI_STATUS Status;
EFI_SERIAL_IO_PROTOCOL *SerialIo;
Status = gBS->OpenProtocol (
    ControllerHandle,
    &gEfiSerialIoProtocolGuid,
    (VOID **) &SerialIo,
    This->DriverBindingHandle,
    ControllerHandle,
    EFI_OPEN_PROTOCOL_BY_DRIVER | EFI_OPEN_PROTOCOL_EXCLUSIVE
);

if (EFI_ERROR (Status)) {
    return Status; // Bail out if OpenProtocol returns an error
}

// We're here because OpenProtocol was a success, so clean up
gBS->CloseProtocol (
    ControllerHandle,
    &gEfiSerialIoProtocolGuid,
    This->DriverBindingHandle,
    ControllerHandle
);

return EFI_SUCCESS;
```

Lab 4: Notice UEFI Driver Wizard Includes

- **Open** C:/FW/edk2-ws/edk2/MyWizardDriver/MyWizardDriver.h
- **Notice** the following include statement is already added by the driver wizard:

```
// Produced Protocols
//
#include <Protocol/SerialIo.h>
```

- **Review** the Libraries section and see that UEFI Driver Wizard automatically includes library headers based on the form information. Also, other common library headers were included

```
// Libraries
//
#include <Library/UefiBootServicesTableLib.h>
#include <Library/MemoryAllocationLib.h>
#include <Library/BaseMemoryLib.h>
#include <Library/BaseLib.h>
#include <Library/UefiLib.h>
#include <Library/DevicePathLib.h>
#include <Library/DebugLib.h>
```

Lab 4: Update the Start()

- **Copy & Paste** the following in MyWizardDriver.c after the #include "MyWizardDriver.h" line:

```
#define DUMMY_SIZE 100*16 // Dummy buffer
CHAR16 *DummyBufferfromStart = NULL;
```

Locate MyWizardDriverDriverBindingStart(), the start function for this driver and comment out the "//" in the line "return EFI_UNSUPPORTED; "

```
EFI_STATUS
EFIAPI
MyWizardDriverDriverBindingStart (
    IN EFI_DRIVER_BINDING_PROTOCOL *This,
    IN EFI_HANDLE
    IN EFI_DEVICE_PATH_PROTOCOL *RemainingDevicePath OPTIONAL
)
{
    // return EFI_UNSUPPORTED;
}
```

Lab 4: Update Start Add Code

Copy & Paste the following code for the start function

MyWizardDriverDriverBindingStart():

```
if (DummyBufferfromStart == NULL) {           // was buffer already allocated?
    DummyBufferfromStart = (CHAR16*)AllocateZeroPool (DUMMY_SIZE * sizeof(CHAR16));
}

if (DummyBufferfromStart == NULL) {
    return EFI_OUT_OF_RESOURCES;           // Exit if the buffer isn't there
}

SetMem16 (DummyBufferfromStart, (DUMMY_SIZE * sizeof(CHAR16)), 0x0042); // Fill buffer

return EFI_SUCCESS;
```

- Notice the Library calls to `AllocateZeroPool()` and `SetMem16()`
- The `start()` function is where there would be calls to `"gBS-InstallMultipleProtocolInterfaces()"`

Lab 4: Debugging before Testing the Driver

UEFI drivers can use the EDK II debug library

DEBUG() include - [DebugLib.h]

DEBUG() Macro statements can show status progress interest points throughout the driver code

```

Developer Command Prompt for VS2015 - RunEmulator.bat
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
BlockSize : 512
LastBlock : FFFFFFFFFFFFFFFF
[MyWizardDriver] Not Supported

[MyWizardDriver] Not Supported

```

Lab 4: Add Debug Statements Supported()

Copy & Paste the following DEBUG() macros for the supported function:

```
Status = gBS->OpenProtocol(
    ControllerHandle,
    &gEfiSerialIoProtocolGuid,
    (VOID **)&SerialIo,
    This->DriverBindingHandle,
    ControllerHandle,
    EFI_OPEN_PROTOCOL_BY_DRIVER | EFI_OPEN_PROTOCOL_EXCLUSIVE
);

if (EFI_ERROR(Status)) {
    DEBUG((EFI_D_INFO, "[MyWizardDriver] Not Supported \r\n"));
    return Status; // Bail out if OpenProtocol returns an error
}

// We're here because OpenProtocol was a success, so clean up
gBS->CloseProtocol(
    ControllerHandle,
    &gEfiSerialIoProtocolGuid,
    This->DriverBindingHandle,
    ControllerHandle
);
DEBUG((EFI_D_INFO, "[MyWizardDriver] Supported SUCCESS\r\n"));
return EFI_SUCCESS;
```

Lab 4: Add Debug Statements Start()

Copy & Paste the following DEBUG macro for the Start function just before the `return EFI_SUCCESS;` statement

```
DEBUG ((EFI_D_INFO, "\r\n***\r\n[MyWizardDriver] Buffer 0x%p\r\n", DummyBufferfromStart));  
return EFI_SUCCESS;
```

Note: This debug macro displays the memory address of the allocated buffer on the debug console

Save `C:/FW/edk2-ws/edk2/MyWizardDriver/MyWizardDriver.c`

Lab 4: Build and Test Driver

At the VS Command Prompt

```
$> Build  
$> RunEmulator.bat
```

Load the UEFI Driver from the shell
At the Shell prompt, type

```
Shell> fs0:  
FS0:\> load MyWizardDriver.efi
```

```
Shell> fs0:  
FS0:\> load MyWizardDriver.efi  
Image 'FS0:\MyWizardDriver.efi' loaded at 5E7F000 - Success  
FS0:\> _
```

Lab 4: Build and Test Driver

- Check the VS console output.
- Notice Debug messages indicate the driver did not return `EFI_SUCCESS` from the “Supported()” function most of the time.
- See that the “Start()” function did get called and a Buffer was allocated.

Exit type `FS0:/ > Reset`

```
Developer Command Prompt for VS2015 - RunEmulator.bat

```

Note: use the right-side scroll bar with mouse to scroll back to see the “Supported SUCCESS”

LAB 5: CREATE A NVRAM VARIABLE

In this lab you'll create a non-volatile UEFI variable (NVRAM), and set and get the variable in the Start function

Use Runtime services to
"SetVariable()" and "GetVariable()"

Lab 5: Adding a NVRAM Variable Steps

1. Create .h file with new `typedef` definition and its own GUID
2. Include the new .h file in the driver's top .h file
3. In the `Start()` make a call to a new function to set/get the new NVRam Variable
4. Before `EntryPoint()` add the new function `CreateNVVariable()` to the driver.c file.

Lab 5: Create a new .h file

Create a new file in your editor called: "MyWizardDriverNVDataStruc.h"

Copy, Paste and then **Save** this file

```
#ifndef _MYWIZARDDRIVERNVDATASTRUC_H_
#define _MYWIZARDDRIVERNVDATASTRUC_H_
#include <Guid/HiiPlatformSetupFormset.h>
#include <Guid/HiiFormMapMethodGuid.h>

#define MYWIZARDDRIVER_VAR_GUID \
{ \
    0x363729f9, 0x35fc, 0x40a6, 0xaf, 0xc8, 0xe8, 0xf5, 0x49, 0x11, 0xf1, 0xd6 \
}

#pragma pack(1)
typedef struct {

    UINT16    MyWizardDriverStringData[20];
    UINT8     MyWizardDriverHexData;
    UINT8     MyWizardDriverBaseAddress;
    UINT8     MyWizardDriverChooseToEnable;

} MYWIZARDDRIVER_CONFIGURATION;

#pragma pack()
#endif
```

Lab 5: Update MyWizardDriver.c

Open "C:/FW/edk2-ws/edk2/MyWizardDriver/MyWizardDriver.c"

Copy & Paste the following 4 lines after the #include "MyWizardDriver.h" statement:

```
#include "MyWizardDriver.h"

EFI_GUID    mMyWizardDriverVarGuid = MYWIZARDDRIVER_VAR_GUID;

CHAR16      mVariableName[] = L"MWD_NVData"; // Use Shell "Dmpstore" to see
MYWIZARDDRIVER_CONFIGURATION mMyWizDrv_Conf_buffer;
MYWIZARDDRIVER_CONFIGURATION *mMyWizDrv_Conf = &mMyWizDrv_Conf_buffer; //use the pointer
```

Lab 5: Update MyWizardDriver.c

Locate "MyWizardDriverDriverBindingStart ()" function

Copy & Paste at the beginning of the start function to declare a local variable

```
EFI_STATUS Status; // Declare a local variable Status
```

Copy & Paste the 6 lines: 1) new call to "CreateNVVariable();" , 2-6) if statement with DEBUG just before the line "return EFI_SUPPORTED" as below:

```
Status = CreateNVVariable();
if (EFI_ERROR(Status)) {
    DEBUG((EFI_D_ERROR, "[MyWizardDriver] NV Variable already created \r\n"));
}
else {
    DEBUG((EFI_D_ERROR, "[MyWizardDriver] Created NV Variable in the Start \r\n"));
}

return EFI_SUCCESS;
```

Lab 5: Update MyWizardDriver.c

Copy & Paste the new function before the call to "MyWizardDriverDriverEntryPoint()"

```
EFI_STATUS
EFI_API
CreateNVVariable()
{
    EFI_STATUS      Status;
    UINTN           BufferSize;

    BufferSize = sizeof (MYWIZARDDRIVER_CONFIGURATION);
    Status = gRT->GetVariable(
        mVariableName,
        &mMyWizardDriverVarGuid,
        NULL,
        &BufferSize,
        mMyWizDrv_Conf
    );
    if (EFI_ERROR(Status)) { // Not defined yet so add it to the NV Variables.
        if (Status == EFI_NOT_FOUND) {
            Status = gRT->SetVariable(
                mVariableName,
                &mMyWizardDriverVarGuid,
                EFI_VARIABLE_NON_VOLATILE | EFI_VARIABLE_BOOTSERVICE_ACCESS,
                sizeof (MYWIZARDDRIVER_CONFIGURATION),
                mMyWizDrv_Conf // buffer is 000000 now for first time set
            );
            DEBUG((EFI_D_INFO, "[MyWizardDriver] Variable %s created in NVRam Var\r\n", mVariableName));
            return EFI_SUCCESS;
        }
    }
    // already defined once
    return EFI_UNSUPPORTED;
}
```

- Note: the `gRT->GetVariable` and `gRT->SetVariable` use Runtime services table
- The Runtime Services Table was not automatically included with the Driver Wizard

Lab 5: Update MyWizardDriver.h

Open "C:/FW/edk2-ws/edk2/ MyWizardDriver/MyWizardDriver.h"

Copy & Paste the following "#include" after the list of library include statements:

```
// Libraries
// . . .
#include <Library/UefiRuntimeServicesTableLib.h>
```

Copy & Paste the following "#include" after the list of protocol include statements:

```
// Produced Protocols
// . . .
#include "MyWizardDriverNVDataStruc.h"
```

Save "C:/FW/edk2-ws/edk2/ MyWizardDriver/MyWizardDriver.h"

Save "C:/FW/edk2-ws/edk2/ MyWizardDriver/MyWizardDriver.c"

Lab 5: Build and Test Driver

At the VS Command Prompt

```
$> Build
$> RunEmulator.bat
```

Load the UEFI Driver

```
Shell> fs0:
FS0:\> load MyWizardDriver.efi
```

Observe the Buffer address returned by the debug statement in the VS Command window and the new NV Variable was created

```
Developer Command Prompt for VS2015 - RunEmulator.bat

```

Note: use the right-side scroll bar with mouse to scroll back to see the “Supported SUCCESS”

Lab 5: Verify Driver

Use the Buffer address pointer in the previous slide then use the “mem” command

At the Shell prompt, type `FS0:\> mem 0x1be2d978018`

Observe the Buffer is filled with the letter "B" or 0x0042

```
FS0:\> mem 1be2d978018
Memory Address 000001BE2D978018 200 Bytes
2D978018: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.B.B.B.B.B.B.B.*

```

Lab 5: Verify NVRAM Created by Driver

At the Shell prompt, type `FS0:\> dmpstore -all -b`

Observe now the NVRAM variable "MWD_NVData" was created and filled with 0x00s

```
FS0:\> dmpstore -all -b
Variable NV+BS '363729F9-35FC-40A6-AFC8-EBF54911F1D6:MWD_NVData' DataSize = 0x2B

000000000: 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00  *.....*
000000010: 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00  *.....*
000000020: 00 00 00 00 00 00 00 00-00 00 00                                *.....*
```

Exit type `FS0:/ > Reset`

LAB 6: PORT STOP AND UNLOAD

In this lab, you'll port the driver's "Unload" and "Stop" functions to free any resources the driver allocated when it was loaded and started.

Lab 6: Port the Unload function

Open "C:/FW/edk2-ws/edk2/MyWizardDriver/MyWizardDriver.c"

Locate "MyWizardDriverUnload ()" function

Copy & Paste the following "if" and "DEBUG" statements before the "return EFI_SUCCESS;" statement.

```
// Do any additional cleanup that is required for this driver
//
if (DummyBufferfromStart != NULL) {
    FreePool(DummyBufferfromStart);
    DEBUG((EFI_D_INFO, "[MyWizardDriver] Unload, clear buffer\r\n"));
}
DEBUG((EFI_D_INFO, "[MyWizardDriver] Unload success\r\n"));

return EFI_SUCCESS;
```

Lab 6: Port the Stop function

Locate "MyWizardDriverDriverBindingStop ()" function

Comment out with "//" before the "return EFI_UNSUPPORTED;" statement.

Copy & Paste the following "if" and "DEBUG" statements before the "return EFI_SUCCESS;" statement.

```
if (DummyBufferfromStart != NULL) {
    FreePool(DummyBufferfromStart);
    DEBUG((EFI_D_INFO, "[MyWizardDriver] Stop, clear buffer\r\n"));
}
DEBUG((EFI_D_INFO, "[MyWizardDriver] Stop, EFI_SUCCESS\r\n"));

return EFI_SUCCESS;
// return EFI_UNSUPPORTED;
}
```

Save & Close "MyWizardDriverDriver.c"

Lab 6: Build and Test Driver

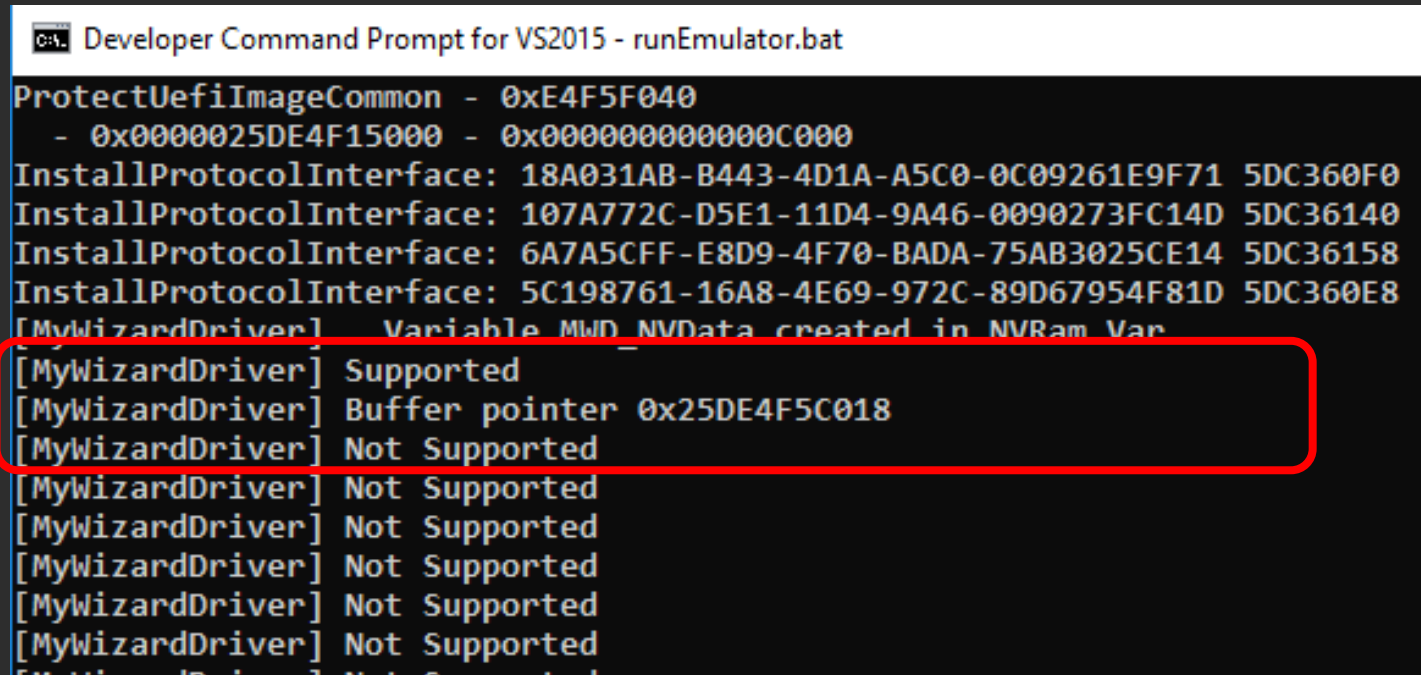

At the VS Command Prompt

```
$> Build
$> RunEmulator.bat
```

Load the UEFI Driver

```
Shell> fs0:
FS0:\> load MyWizardDriver.efi
```

Observe the Buffer address is at
0x25DE4F5C018 as this slide example

```
Developer Command Prompt for VS2015 - runEmulator.bat
ProtectUefiImageCommon - 0xE4F5F040
- 0x0000025DE4F15000 - 0x0000000000000C000

[MyWizardDriver] Buffer pointer 0x25DE4F5C018
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
[MyWizardDriver] Not Supported
```

Lab 6: Verify Driver

At the Shell prompt, type **FS0:\> drivers**

Observe the handle is "A9" as this slide example

Type: **mem 0x25DE4F5C018**

Observe the buffer was filled with the "0x0042"

```
92 00000011 ? - - - - Usb Mass Storage Driver      UsbMassSt
93 00000010 B - - 1 1 QEMU Video Driver              QemuVideo
94 00000010 ? - - - - Virtio GPU Driver              VirtioGpu
A9 00000000 ? - - - - UEFI Sample Driver             \MyWizard
```

```
FS0:\> _
```

```
FS0:\> mem 25de4f5c018
```

```
Memory Address 0000025DE4F5C018 200 Bytes
```

```
E4F5C018: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
E4F5C028: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
E4F5C038: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
E4F5C048: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
E4F5C058: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
E4F5C068: 42 00 42 00 42 00 42 00-42 00 42 00 42 00 42 00 *B.1
```

Lab 6: Verify Unload

At the Shell prompt, type `FS0:\> unload a9`

Observe the DEBUG messages from the Unload in the VS Command Window

Type Drivers again to verify

```
FS0:\> unload a9
Unload - Handle [6B1B798]. [y/n]?
y
Unload - Handle [6B1B798] Result Success.
FS0:\> _
```

```
[MyWizardDriver] Unload, clear buffer
[MyWizardDriver] Unload success
```

Lab 6: Verify Unload

At the Shell prompt, type `FS0:\> mem 0x25DE4F5C018`

Observe the buffer is now NOT filled

```
FS0:\> Mem 25DE4F5C018
Memory Address 0000000006808018 200 Bytes
06808018: AF AF AF AF AF AF AF AF-AF AF AF AF AF AF AF AF *.....*
06808028: AF AF AF AF AF AF AF AF-AF AF AF AF AF AF AF AF *.....*
06808038: AF AF AF AF AF AF AF AF-AF AF AF AF AF AF AF AF *.....*
06808048: AF AF AF AF AF AF AF AF-AF AF AF AF AF AF AF AF *.....*
```

Exit Type `FS0:\> reset`

Adding strings and forms to setup (HII)

Publish & consume protocols

Hardware initialization

Refer to the UEFI Drivers Writer's Guide for more tips— [Pdf link](#)

Summary

- ★ Compile a UEFI driver template created from UEFI Driver Wizard
- ★ Test driver in Windows Emulation using UEFI Shell 2.0
- ★ Port code into the template driver
