

UEFI & EDK II Training PLATFORM BUILD LAB - OVMF

tianocore.org

PLATFORM BUILD LABS

Run Ovmf using Qemu

BUILD OVMFPKG

Setup OvmfPkg to build and run w/ QEMU

Pre-requisites Ubuntu 16.04

Instructions from: tianocore wiki Ubuntu_1610

Example Ubuntu 16.04

The following need to be accessible for building Edk2, From the terminal prompt (Cnt-Alt-T):

bash\$ sudo apt-get install build-essential uuid-dev iasl git gcc-5 nasm python3-distutils

```
build-essential - Informational list of build-essential packages uuid-dev - Universally Unique ID library (headers and static libraries) iasl - Intel ASL compiler/decompiler (also provided by acpica-tools) git - support for git revision control system gcc-5 - GNU C compiler (v5.4.0 as of Ubuntu 16.04 LTS) nasm - General-purpose x86 assembler python3 - distutils - distutils module from the Python standard library
```

bash\$ sudo apt-get install qemu

Qemu – Emulation with Intel architecture with UEFI Shell

Pre-requisites Clear Linux* Project

Example Using Clear Linux* Project The following need to be accessible for building Edk2, From the terminal prompt (Cnt-Alt-T):

bash\$ sudo swupd bundle-add devpkg-util-linux

Devpkg-util-linux - includes bundles for developer tools for writing "C" Applications included: gcc, nasm, uuid, etc.

bash\$ sudo swupd bundle-add kvm-host

Qemu – Emulation with Intel architecture with UEFI Shell

Create QEMU Run Script

1. Create a run-ovmf directory under the home directory

```
bash$ cd ~
bash$ mkdir ~run-ovmf
bash$ cd run-ovmf
```

- 2. Create a directory to use as a hard disk image bash\$ mkdir hda-contents
- 3. Create a Linux shell script to run the QEMU from the run-ovmf directory bash\$ gedit RunQemu.sh

4. Save and Exit

DOWNLOAD the EDK II Source

Open a terminal prompt and create a source working directory

```
bash$ mkdir ~/src
bash$ cd ~/src
bash$ mkdir edk2-ws
```

Internet Proxies – (company Firewall used for example)

```
bash$ export http_proxy=http://proxy-us.company.com:911
bash$ export ftp_proxy=$http_proxy
```

Download edk2 source tree using Git

```
bash$ git clone -b Edk2Lab_22Q1 https://github.com/tianocore-training/edk2.git
Bash$ git clone https://github.com/tianocore/edk2-libc.git
```

Download the Submodules and Checkout the Lab Branch

```
bash$ cd edk2
bash$ submodule update -init
bash$ cd ..
```

SETUP LAB MATERIAL

Lab_Material_FW.zip

DOWNLOAD LAB MATERIAL

Lab_Matrial_FW.zip

OR

Use git clone to download the Lab_Material_FW

```
bash$ cd $HOME
bash$ git clone https://github.com/tianocore-training/Lab_Material_FW.git
```

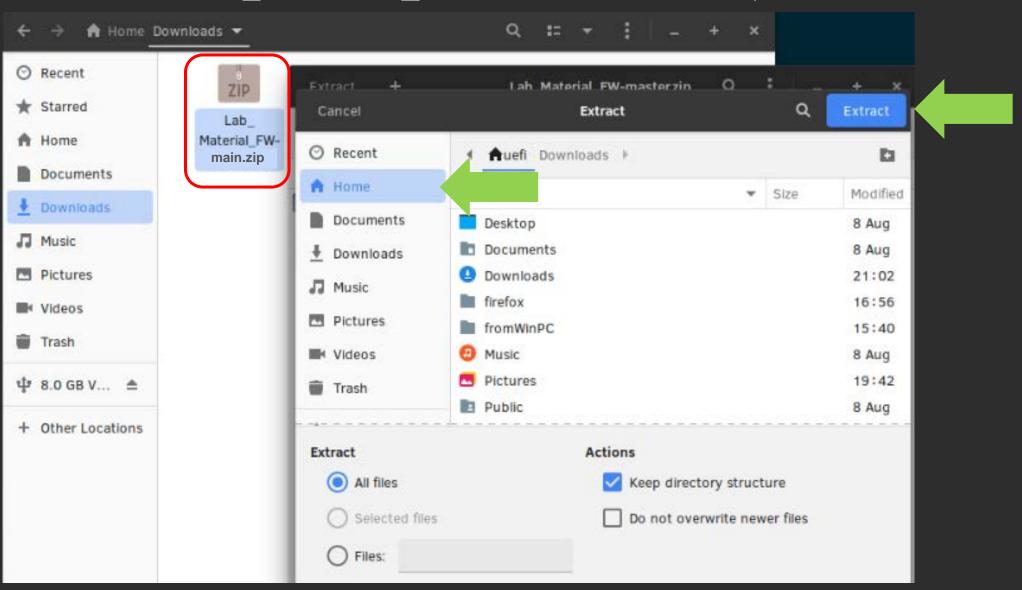

Directory Lab_Material_FW will be created

- Documentation
- DriverWizard
- edk2-ws
- edk2Linux
- LabSampleCode

-Extract the Source

1. Extract the Downloaded Lab_Material_FW-main.zip to Home (this will create a directory ~/FW)

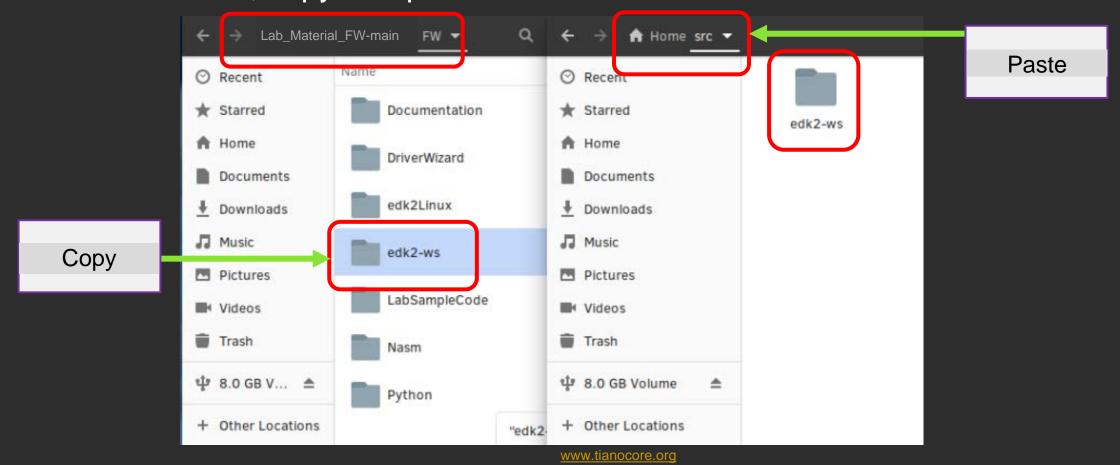

BUILD EDK II OVMF - Copy the Source

- 2. Open a terminal prompt (Alt-Cnt-T)
- 3. Create a working space source directory under the home directory

bash\$ cd ~src

4. From the FW folder, copy and paste folder "~.../FW/edk2-ws" to ~src

- Building BaseTools

```
5. Export work space & platform path
```

```
bash$ cd ~src/edk2-ws
bash$ export WORKSPACE=$PWD
bash$ export PACKAGES_PATH=$WORKSPACE/edk2:$WORKSPACE/edk2-libc
```

6. Run Make
bash\$ cd edk2
bash\$ make -C BaseTools/

7. Make sure the tests pass OK

```

uefi@clr-0~/src/edk2-ws/edk2 $
```

BUILD OVMF PLATFORM

BUILD EDK II OVMF -Update Target.txt

What is OVMF?

Open Virtual Machine Firmware - Build with edk2

```
bash$ cd ~/src/edk-ws/edk2
bash$ . edksetup.sh
```

```
uefi@clr-0~/src/edk2-ws/edk2 $ . edksetup.sh
Loading previous configuration from /home/uefi/src/edk2-ws/edk2/Conf/Build
WORKSPACE: /home/uefi/src/edk2-ws
EDK_TOOLS_PATH: /home/uefi/src/edk2-ws/edk2/BaseTools
CONF_PATH: /home/uefi/src/edk2-ws/edk2/Conf
uefi@clr-0~/src/edk2-ws/edk2 $
```

Edit the file Conf/target.txt

bash\$ gedit Conf/target.txt

Save and build

bash\$ build -D ADD_SHELL_STRING

More info: tianocore - wiki/OVMF

-Inside Terminal

```

Processing meta-data ..
```

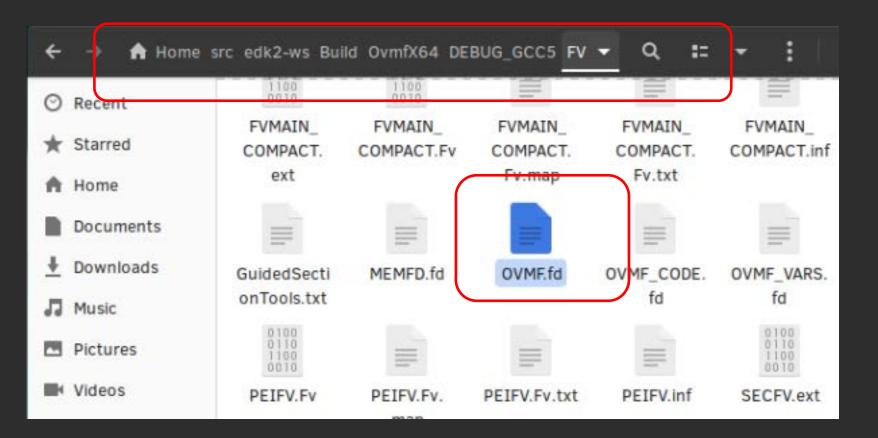

-Verify Build Succeeded

OVMF.fd should be in the Build directory

• For GCC5 with X64, it should be located at

~/src/edk2-ws/Build/OvmfX64/DEBUG_GCC5/FV/OVMF.fd

INVOKE QEMU

Change to run-ovmf directory under the home directory

bash\$ cd \$HOME/run-ovmf

Copy the OVMF.fd BIOS image created from the build to the run-ovmf directory naming it bios.bin

bash\$ cp ~/src/edk2ws/Build/OvmfX64/DEBUG_GCC5/FV/OVMF.fd bios.bin

Run the RunQemu.sh Linux shell script bash\$. RunQemu.sh

Exit QEMU

SUMMARY

- Build a EDK II Platform using OVMF package
- Run Ovmf using Qemu

Return to Main Training Page

Return to Training Table of contents for next presentation link
